Breadth First Search (BFS)
Part 2

Shortest Path Recording

- BFS we saw only tells us whether a path exists from source s, to other vertices v.
  - It doesn't tell us the path!
  - We need to modify the algorithm to record the path

- How can we do that?
  - Note: we do not know which vertices lie on this path until we reach v!
  - Efficient solution:
    - Use an additional array *pred[0..n-1]*
    - *Pred[w] = v means that vertex w was visited from v*

BFS + Path Finding

Algorithm *BFS*(s)

for each vertex v
  do $\mathit{flag}(v) :=$ false;
    $\boxed{\mathit{pred}[v] := -1;}$
$Q =$ empty queue;
$\mathit{flag}[s] :=$ true;
enqueue(Q, s);
while Q is not empty
  do $v :=$ *dequeue*(Q);
    for each w adjacent to v
      do if $\mathit{flag}[w] =$ false
        then $\mathit{flag}[w] :=$ true;
          $\boxed{\mathit{pred}[w] := v;}$
          enqueue(Q, w)

initialize
all pred[v] to -1

Record where
you came from

Recursive algorithm

Algorithm *Path*(w)
1. **if** $pred[w] \neq -1$
2. **then**
3. *Path*($pred[w]$);
4. output w

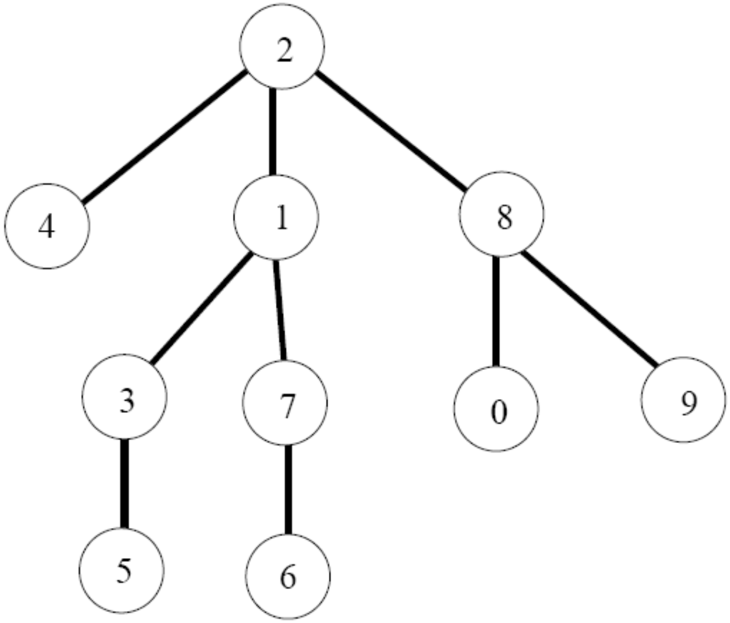
Try some examples, report path from s to v:
Path(0) ->
Path(6) ->
Path(1) ->

The path returned is the shortest from s to v (minimum number of edges).

BFS Tree

- The paths found by BFS is often drawn as a rooted tree (called BFS tree), with the starting vertex as the root of the tree.

BFS tree for vertex s=2.

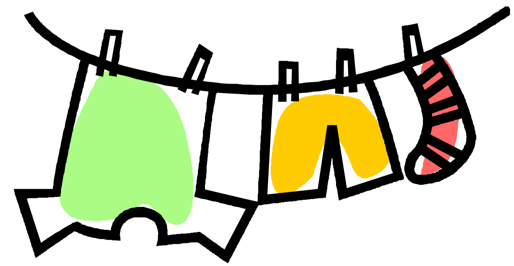


Question: What would a “level” order traversal tell you?

Record the Shortest Distance

Algorithm $\mathit{BFS}(s)$

for each vertex v
  do $\mathit{flag}(v) :=$ false;
    $\mathit{pred}[v] := -1$; d(v) = ∞;
$Q =$ empty queue;
$\mathit{flag}[s] :=$ true; d(s) = 0;
$\mathit{enqueue}(Q, s)$;
while Q is not empty
  do $v := \mathit{dequeue}(Q)$;
    for each w adjacent to v
      do if $\mathit{flag}[w] =$ false
        then $\mathit{flag}[w] :=$ true;
        d(w)=d(v)+1; $\mathit{pred}[w] := v$;
        $\mathit{enqueue}(Q, w)$



Application of BFS

- One application concerns how to find connected components in a graph

- If a graph has more than one connected components, BFS builds a BFS-forest (not just BFS-tree)!
  - Each tree in the forest is a connected component.
